DEMO: this is a sample report made on my own test page and my own GTM and GA4 demo accounts. It is not client data.

Sample tracking audit: 3 issues found and fixed

Test date: 2026-10-15. Tools: Google Tag Manager Preview (Tag Assistant), GA4 DebugView. Browser: Chrome on Windows 11. Page: GitHub Pages test page with a contact form, phone link, email link, CTA button and a PDF link.

1. Summary

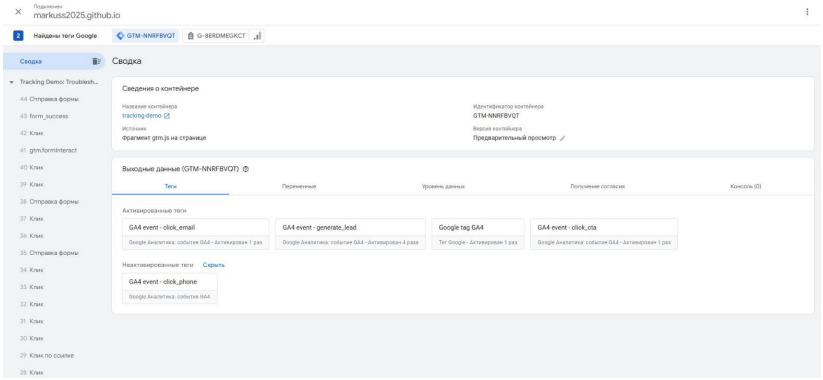

I built a test page with three typical tracking mistakes, found each one with GTM Preview and GA4 DebugView, fixed it in Tag Manager and tested again. Only event counts that I saw during the tests are reported. No business results were measured.

2. Findings

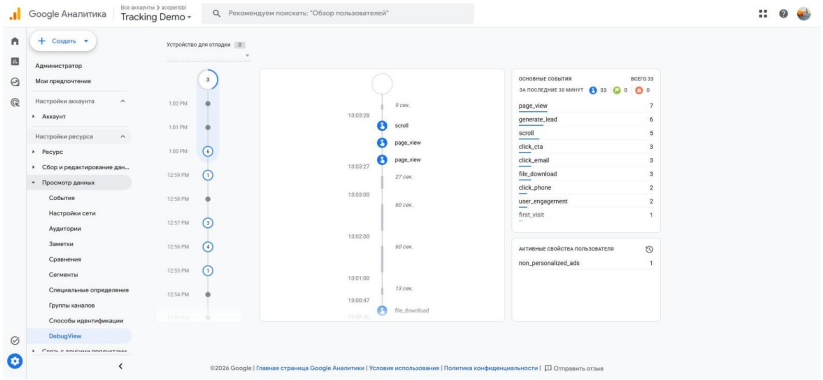

#	Issue	Impact	Evidence (before)	Fix	Status after retest
1	Lead event fires on a click on the Send button, not on a successful form	Empty or invalid submits are counted as leads (3 empty clicks gave 3 generate_lead)	Tag Assistant: generate_lead fired 4 times for 3 empty and 1 valid submit	Trigger changed to Custom Event form_success	Fixed: empty submit = 0, valid submit = 1
2	Extra GA4 event tag named page_view fires on All Pages	Every page load is counted twice (inflated page views, wrong engagement data)	Tag Assistant and DebugView: 2 page_view in the same second on one load	Extra tag removed, only the Google tag sends page_view	Fixed: 1 page_view per load
3	Phone click is not tracked	Phone clicks are missing from reports	Tag Assistant: click_phone tag not fired after a click on the phone icon	Trigger changed from Click Text contains "Call" to Click URL starts with tel:	Fixed: 1 click_phone per click

Other checks (passed in both runs): email link = 1 click_email, CTA button = 1 click_cta, PDF link = 1 file_download (GA4 enhanced measurement).

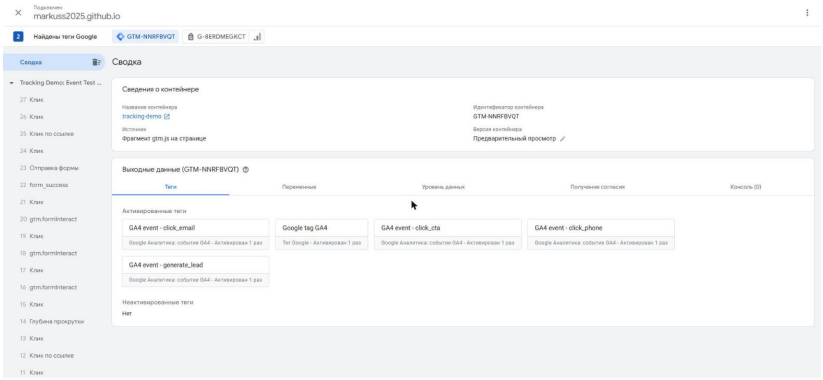

3. Evidence screenshots (raw, not edited)

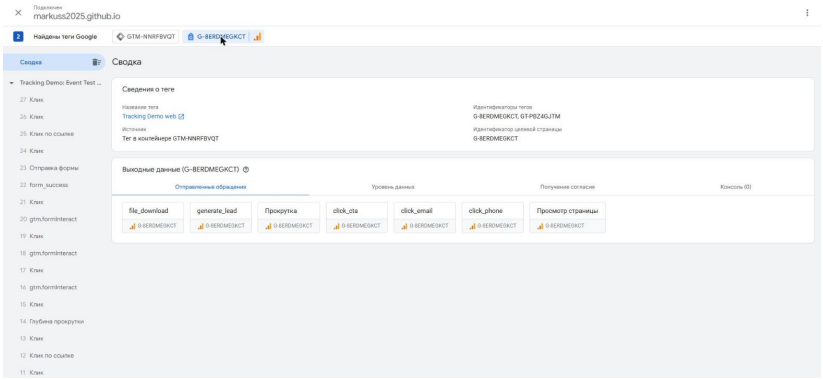

Before: generate_lead fired 4 times, click_phone not fired (Tag Assistant).

Before: two page_view in the same second on one page load (GA4 DebugView, 13:03:27).

After: each tag fired once, click_phone fired (Tag Assistant, fixed container, correct page).

After: hits sent to GA4: one page view, one generate_lead, click_phone, click_email, click_cta, file_download.

4. Test log

Test	Action	Expected	Before fix	After fix
Page load	open page once	1 page_view	2	1
Empty form	click Send, fields empty	0 generate_lead	1 per click	0
Valid form	fill fields, click Send	1 generate_lead	1	1
Phone link	click phone	1 click_phone	0	1
Email link	click mailto	1 click_email	1	1
CTA button	click Book a free check	1 click_cta	1	1
PDF link	click PDF link	1 file_download	1	1

5. Notes and limits

- A hard-coded gtag.js with the same Measurement ID next to the GTM Google tag did not create a second page_view in this test, so I used an extra GA4 event tag to build the duplicate. Other duplicate causes were not tested.

- Events sent in debug mode appear in standard GA4 reports and in the Events list only after processing (up to 24 hours). Standard reports and key events are not part of this test.

- Tested on one browser (Chrome, Windows 11). Mobile, other browsers and consent banners were not tested.

- The GTM container before and after the fix is attached as JSON files (container-before-3-bugs.json, container-after.json).
